An adaptive simulation analysis of reliability model for the system of supply chain based on partial differential equations

Mian Zhang, Jinbo Chen *, Sheng-Hung Chang

School of Business Administration, Hubei University of Economics, Wuhan 430205, China

Received 3 January 2020; revised 29 February 2020; accepted 3 March 2020

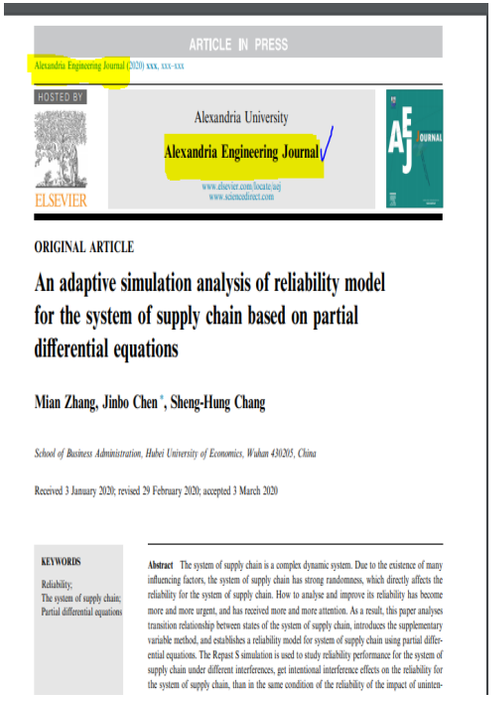

KEYWORDS

Reliability;
The system of supply chain;
Partial differential equations

Abstract The system of supply chain is a complex dynamic system. Due to the existence of many influencing factors, the system of supply chain has strong randomness, which directly affects the reliability for the system of supply chain. How to analyse and improve its reliability has become more and more urgent, and has received more and more attention. As a result, this paper analyses transition relationship between states of the system of supply chain, introduces the supplementary variable method, and establishes a reliability model for system of supply chain using partial differential equations. The Repast S simulation is used to study reliability performance for the system of supply chain under different interferences, get intentional interference effects on the reliability for the system of supply chain, than in the same condition of the reliability of the impact of uninten-
